

# SQLCipher for Android: 16KB Page Size Support (/blog/2025/06/26/sqlcipher-for-android-16kb-page-size-support/)

2025-06-26 08:00:00 -0400

Google is now making 16KB page compatibility required for applications in the Play Store (<https://developer.android.com/guide/practices/page-sizes>). To support this requirement, native libraries for Android must be specifically built to support 16KB page sizes.

While the modern SQLCipher for Android library (</sqlcipher/sqlcipher-for-android/>) has fully supported 16KB page sizes since version 4.6.1 (</blog/2024/08/20/sqlcipher-4.6.1-release/>), the legacy Community Edition of `android-database-sqlcipher` is no longer supported or receiving published updates. It was deprecated in 2022 and reached end-of-life in 2023. As a result, applications still using the `android-database-sqlcipher` Community Edition package will not be able to meet Google's new requirement.

There are two supported options for affected applications:

1. Upgrade to the new `sqlcipher-android` library - As the official replacement library, it has been already updated for 16KB page size support. There are steps involved in migrating (</sqlcipher/sqlcipher-for-android-migration/>), but most applications should only require minor modifications. As a bonus, applications will see improved stability and better performance from the new library.
2. License SQLCipher for Android Commercial Edition - We continue to provide limited, post-end-of-life, support for the legacy library to commercial customers. This includes an `android-database-sqlcipher` compatibility package with 16KB page size support. It will meet Google's new mandate. If you are interested, please contact us (</contact/>) to discuss options, or license directly online (<https://www.zetetic.net/sqlcipher/commercial/>).

We recommend that applications address these requirements as a priority, as Android 15 is now rolling out to devices.

## About Zetetic

Zetetic LLC is a small company specializing in applied data security. As the developers behind the SQLCipher (/sqlcipher/) encrypted database library and Codebook (/codebook/) Password Manager, hundreds of organizations and millions of users trust Zetetic's software and frameworks.
